Dear Minister Myers:

Re: the proposed Skinners Pond Wind Energy Centre

I'm writing this letter in support of the Skinners Pond Wind Energy Centre www.skinnerspondwind.com, a project conceived in late 2007 by a large group of local landowners (the "Landowners" or the "Group"), who were determined to develop renewable energy in Skinners Pond. In a concentrated area of highly energetic West Prince wind, the Group owns over 4,000 acres. This land assembly is large enough to host a wind project that could easily scale from 30 MW to beyond 100 MW. In fact, Skinners Pond has the potential to supply all of PEI's new renewable energy needs for the foreseeable future, and as well provide PEI with the capacity to export clean power to neighbouring provinces.

A Community Project

The Skinners Pond Wind Energy Centre ("Skinners Pond" or "the Project") has a unique history. While most Maritime wind projects were launched by a renewable energy company or a government wind developer, in the case of Skinners Pond, the Group's dozens of local landowners came together to pool their respective acreage within a large, well-defined area of land suitable for a wind farm. The Group then held a competition among interested and qualified organizations for the right to move the Project forward. Ultimately, in March 2008 they selected Invenergy over other candidate developers from the USA, Canada and Europe. Between then and now, new transmission has been built to other areas of the Island enabling several 30MW windfarms to be connected, however no such grid has been built into the north end of West Prince county. Despite being hamstrung by this lack of enabling infrastructure, the Project lands remain intact and the Landowners united, a tribute to the vision of the community and the strength of their resolve.

Co-operative-Based Business Model

The Skinners Pond land agreements reflect a business structure that has been the cornerstone of many West Prince enterprises for generations – the co-operative. Once the wind farm is operational, the majority of landowner rent will be distributed to all of the Landowners based on their respective contribution of acres to the project, regardless of whether any infrastructure is located on their land. Those Landowners hosting turbines will share in the balance of the rent, and Landowners hosting other project components (cabling, laneway, etc) will be additionally compensated on a \$/square meter basis. Invenergy has also committed to financing a post-commissioning community benefit fund at the annual rate of \$500/MW of nameplate capacity. In summary, a co-operative business approach, consideration for community members who aren't Landowners, together with Invenergy's strong stakeholder engagement in the region has built substantial public support for the Project's success.

The Right Project

As a stakeholder for the proposed project, I have followed the local opposition to wind development in other areas of the island. To watch as other Island wind projects that are not community-driven are developed and commissioned in the interim has been a frustration. Given the solid local support for Skinners Pond, there would not be similar roadblocks here - quite simply, we want the Project to proceed.

The Right Timing for Enabling Infrastructure

Should the recent major drop in energy use and energy pricing also cause the postponement of the currently proposed Eastern Kings project, there is another infrastructure project that could step into the breach, ie: the permitting and construction of a new transmission line to service northern West Prince. This new infrastructure would enable the phasing in of the Skinners Pond project as and when new domestic supplies of renewable energy are required, in addition to providing a greater and more reliable power supply to support West Prince's growth.

Skinners Pond would bring significant economic investment into West Prince and those benefits are amplified by Invenergy's community-driven approach for the project. Skinners Pond is the right project for Prince Edward Island and now is the right time to enable it through the long-awaited expansion of PEI's 138kV electrical grid.

Sincerely,

Leo Gaudet
